

Machine Learning Potentials for Molecules and Materials

Murat Keçeli
Computational Science Division
Argonne National Laboratory

Research Overview

- Development of NWChemEx, VALENCE, QTC, Auto-Mech, SIESTA-SIPs, MaVi.
- Accurate electronic structure calculations and thermochemistry with composite methods
- Workflows for high-throughput quantum chemistry calculations
- Machine learning interatomic potentials
- Thermoelectric properties of 2D materials
- Molecular growth and soot formation

Wavefunction based accurate methods for large scale calculations

“From NWChem to NWChemEx: Evolving with the Computational Chemistry Landscape”, *Chem. Rev.*, **2021**.

“PluginPlay: Enabling Exascale Scientific Software One Module at a Time”, *J. Chem. Phys.*, **2023**.

Massively Parallel Sparse Eigensolvers

“SIESTA-SIPs: Massively parallel spectrum-slicing eigensolver for an ab initio molecular dynamics package” *J. Comput. Chem.* **2018**.
“ELSI — An Open Infrastructure for Electronic Structure Solvers” *Comput. Phys. Commun.* **2020**.

Automated workflows for accurate thermochemistry and kinetics

“Automated Theoretical Chemical Kinetics: Predicting the Kinetics for the Initial Stages of Pyrolysis” *Proc. Combust. Inst.* **2021**.

“Systematically derived thermodynamic properties for alkane oxidation”, *Combustion and Flame*, **2023**.

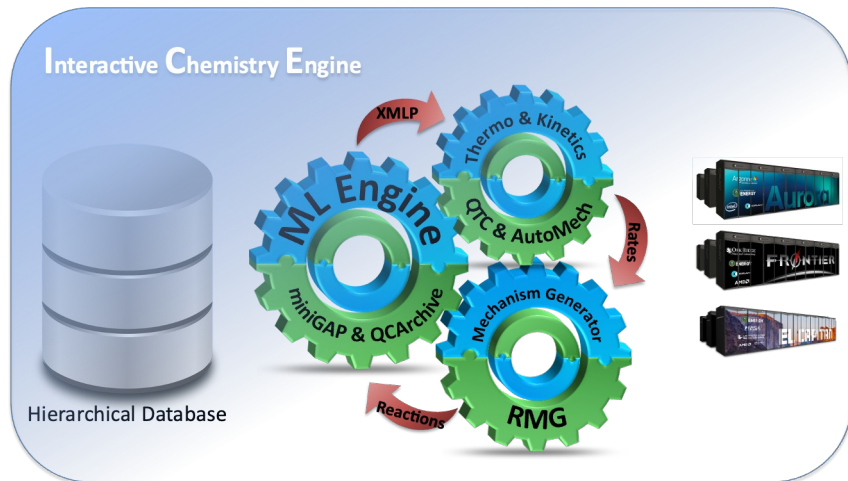

ML-based potentials for 2D materials

“Computation of the Thermal Expansion Coefficient of Graphene with Gaussian Approximation Potentials”. *J. Phys. Chem. C* **2021**
“Gaussian approximation potentials for accurate thermal properties of two-dimensional materials” *Nanoscale* **2023**

Accelerating Quantum Chemistry

- Ever-increasing computing power, simulation data, and machine learning tools.
- Coupling machine learning and simulations and providing a user-friendly interface to these tools and HPC resources are the keys to solve challenging problems in chemistry and material science.

Interactive Chemistry Engine

Number of nodes	128
Server	ThetaGPU
Max time (min)	720
Species list (label:SMILES)	Methane:C, Ethane:CC, O2:O[O]
Mole fractions (label:fraction)	1
Temperature (K)	1300
Pressure (bar)	1
Reactor type	Simple
High-level method	CCSD(T)/F12/aug-cc-pvtz-f12
Low-level method	DL-PNO-CCSD(T)/F12/cc-pvtz
Uncertainty (kcal/mol)	1
Thermo libraries	primaryThermoLibrary, iceTherm20112
Kinetic repositories	training
Filter Reactions	<input type="checkbox"/>
Submit	<input type="button" value="submit"/>

ICE input
